A 62 years old male patient MADHUNAIAH came with c/o slurring of speech a/w right sided weakness of both upper limb and lower limb. K/c/o CAD-Old IWMI. All necessary investigations were done and diagnosed as ACUTE INTRAPARENCHYMAL BLEED. Managed conservatively. Patient developed bradycardia and hypotension, emergency intubation was done and connected to Mechanical Ventilator support on SIMV mode with fio2-100%. Inotropes support were started for Hypotension. Patient condition was explained to

patient attendants. On 26/12/2020 at 10.50 am patient had cardiac arrest, BP not recordable with inotropes support, immediately CPR started according to ACLS guidelines. inj. Adrenaline given every 3 minutes. Patient not responded to given treatment. CPR continued. Multiple doses of inj. Adrenaline given. Patient not reverted to Normal Sinus Rhythm. Pupils dilated and fixed, Carotid pulse not felt. 12 lead ECG showed asystole, hence declared dead at 11.20am on 26/12/2020.

Disease	Disease Type
SEPSIS WITH MODS SECONDARY TO PYOGENIC LIVER ABSCESS.	

C/o shortness of breath grade III-IV since 1 week, aggravated since 1-2 days
H/o fever 1 month ago
H/o abdominal distension since 1 month
H/o decreased appetite since 1 month

AT ADMISSION:

Afebrile, tachypneic

PR: 110/min

BP: 110/70mmHg

RS: BAE+

CVS: S1S2, tachycardia observed

RR: 28/min

SPO2: 98% with 4 Ltr O2/min

P/A: Distended diffuse tenderness was observed to superficial palpation, gross hepatomegaly was observed

A 70 years old male Mr. MALLAIAH patient presented with the above-mentioned complaints. An ultrasound abdomen revealed multiple liver abscesses CT abdomen was done, which showed features suggestive of pyogenic liver abscess. General Surgery consultation was done and was advised pigtail catheterisation after patient stabilization. Patient was started on INJ. MEROPENEM INJ. THIAMINE and INJ. METROGYL. Patient condition worsened within hours of hospitalization. Patient had no urine output patient, had severe respiratory distress, so patient was intubated in view of severe respiratory distress. Inotropic support was started in view of hypotension. At 6:30 p.m. patient had a sudden cardiac arrest and CPR was initiated according to ACLS guidelines. Despite best efforts patient could not be revived, hence declared dead at 6 p.m. 6:37 p.m. on 10/02/2022.

Discussion

A 78 years old male patient Mr. RAMCHANDRAM presented with the above-mentioned complaints. 2D Echo was done which showed global hypokinesia of left ventricle and severe mitral regurgitation, EF of 28%. Patient was diagnosed to have heart failure with reduced ejection fraction. Patient was started with TAB. VYMADA 50 mg 1-0-1 INJ. LASIX 40 mg IV 1-0-0 and fluid restrictions. Now the patient symptomatically better hence being discharged with the following medication.

DISCHARGE MEDICATION:

1. TAB. VYMADA 50 MG TWICE DAILY AT 8AM AND 8PM TO CONTINUE
2. TAB. DYTOR PLUS 10 MG ONCE DAILY AT 8AM TO CONTINUE
3. TAB. CARVEDILOL 3.125 TWICE DAILY AT 8AM AND 8PM TO CONTINUE

SPO2: 93% on 2Litr O2

P/A: Soft

A 93 years old female patient RATHNAMMA presented with the above-mentioned complaints patient was treated with 3% NACL infusion for symptomatic hyponatraemia. Patient was started on INJ.CEFTAZIDIME-TAZOBACTAM in view of urinary tract infection. CT brain was done which was normal. An ENT consultation was done as patient had difficulty in swallowing, only nasal endoscopy could be done as patient was not cooperative for laryngoscopy. Advised CT neck but attenders are unwilling since hence CT neck not done. Patient was initially on oxygen support about 10 L/min. Now the patient is of oxygen support is 93% stable on room air. Now the patient's attenders want discharge. Hence patient is being discharged against medical advice, risks have been explained.

P/A: Tenderness to superficial palpation in a in epigastric region

A 64-year-old male patient Mr. NARAYAN MALLAYYA TALAPELLI presented with the above-mentioned complaints who is a known case of hypertension and COPD. Patient had a history of community acquired pneumonia 3 months ago. Patient was admitted and evaluated thoroughly, on investigation Sr. LIPASE was elevated, CT abdomen revealed ACUTE PANCREATITIS, GALLSTONES, DILATED CBD WITH IHBD. Patient diagnosed as gallstone induced acute pancreatitis, acute type II respiratory failure. During the course in the hospital patient was managed with antiemetics, antacids, anticoagulants and antibiotics. As patient was not maintaining the saturation he was put on minimal oxygen support 4-2 Ltr of O2 support. In view of CBD dilatation MRCP was done which revealed Cholelithiasis with biliary sludge, Dilated CBD cystic duct common hepatic duct right leg, left hepatic ducts and intrahepatic biliary radicals ---? due to spasm of sphincter of Oddi, for which general Surgeon consultation was taken and Lap cholecystectomy was planned. Patient attendants are unwilling. Hence, patient is being discharged with medications and to be further followed with general surgeon.

A 60 yrs old Mr Mallesham patient presented with c/o altered sensorium since today morning 6 AM on 29/01/2022 associated with slurring of speech, History of giddiness fall at home since 29/01/2022, Known case of type type II DM on irregular medication, status post-right upper limb amputation 20 years ago . Patient was admitted and evaluated thoroughly and on MRI brain patient was diagnosed to have intraparenchymal bleed in left capsuloganglionic region . Left fronto-parietal deep brain decompression craniectomy was planned and done on 29/01/2022 during the procedure patient was intubated and connected to mechanical ventilator. On 01/02/2022 at 7 AM patient had a history of seizures generalised tonic clonic and a hypotensive shock. The patient was resuscitated on ionotropes and VC/AC mode. During the course patient had fever spikes 100 F, tracheostomy was planned and done on 02/02/2022 at 5 p.m. Later Patient developed thick secretions diagnosed to have nosocomial pneumonia antibiotics were escalated. On 07/02/2022 T-piece trial

with thermovent was done which was uneventful and patient was maintaining saturations at room air, Sr.Electrolytes and ABG was monitored . Elective percutaneous tracheostomy done on 02.02.2022 in view of prolonged ventilator support. Patient is haemodynamically stable off ventilator support maintaining saturations. Patient condition explained to patient attenders and has been referred to neuro-rehabilitation Centre at request

DISCHARGE MEDICATION:

1. TAB. PAN 40MG ONCE DAILY AT 7AM (BBF) FOR 10 DAYS.
2. TAB. LEVIPIL 500 MG TWICE DAILY AT 8AM AND 8PM TO CONTINUE

P/A: tenderness to palpation

GCS-12/15

A 75 years old male patient Mr. N RAJESHAM presented with the above-mentioned complaints. Patient was recently admitted for COVID-19, 10 days ago and has been bedridden and cognition has been impaired since then. Now the patient presented with features of diabetic ketoacidosis and AKI. IV fluids and Insulin infusion were given and potassium supplementation was given. Patient was started on DUOLIN and BUDECORT nebulisation and HEPARIN for DVT prophylaxis. Patient had fever spikes patient was started on broad spectrum antibiotics. Patient's clinical status improved and cognition improved over the course of hospitalisation, but he persistently had fever spikes so antibiotics were stepped up to COLISTIN and TEICOPLANIN and 2D echo was done shows normal. Despite antibiotics patient persisted to have fever spikes and his BP was on the lower side, so patient was started on inotropic support and are suspecting pyelonephritis. The CT KUB was done which showed features suggestive of bilateral pyelonephritis. Urology consultation was taken and patient was planned for DJ stenting. DJ stenting was done, despite DJ stenting patient did not improve. Patient's creatinine was on the rising trend and patient started to have recurrent hypoglycaemia and patient developed ARDS thrombocytopenia and AKI was sent. A nephrology opinion was taken in view of severe metabolic acidosis and dialysis was planned, but at to 2.10 p.m. on 23/02/2022. Patient developed bradycardia. CPR initiated according to ACLS guidelines but despite best efforts patient could not be revived and hence declared dead at 2:18 p.m. on 23 /02/ 2022.

CAUSE OF DEATH

SEPSIS WITH MULTIPLE ORGAN DYSFUNCTION SYNDROME.

54865 kiran 38

A 38 years old male patient Mr. E KIRAN presented to hospital with c/o chest heaviness, SOB on exertion, chest pain, intercapsular radiating to back associated with palpitations since 6-7 days. Symptoms aggravated since 23/02/2022. H/o fever with chills, cold and cough with eye burning since 3 days. All necessary investigations were done and diagnosed as CORONARY ARTERY DISEASE, EVOLVED ANTERIOR WALL MI, MILD MR, SR, SEVERE LV SYSTOLIC DYSFUNCTION, EF-20%. LV BLOOD CLOTS. VT 2 EPISODES /DC SHOCK SR. Intermittent NIV support was given in view of desaturation. Poor prognosis explained to the patient attendants, suddenly patient, developed severe bradycardia. INJ. Atropine and INJ. ADRENALINE given and patient desaturated, immediately, emergency intubation was done and connected to mechanical ventilator on SIMV mode with Fio2-100% and inotropic support was given. CPR started immediately, continued for 45 minutes, according to ACLS guidelines. Patient reverted to NSR. CPR was continued, patient not reverted. 12 lead ECG showed flat line, peripheral pulses not felt, declared death at 3.40 PM on 01/03/2022.

CAUSE OF DEATH

CARDIOPULMONARY ARREST SECONDARY TO CORONARY ARTERY DISEASE, EVOLVED
 ANTERIOR WALL MI,
 MILD MR, SR, SEVERE LV SYSTOLIC DYSFUNCTION, EF-20%, LV BLOOD CLOTS, VT 2
 EPISODES /DC SHOCK SR.

REVIEW AFTER 7 DAYS IN GENERAL MEDICINE OPD

shahin

Patient presented with the above-mentioned complaints. Patient was treated with IV fluids actrapid infusion and CEFTAZIDIME and TAZOBACTAM. Daily ABG monitoring was done daily blood sugars were monitored patient was treated as diabetic ketoacidosis with underlying cardiogenic shock. 2D echo revealed severe LV dysfunction with inferior wall akinesia, Cardiologist consultation taken and planned CAG at a later date.

Now the patient is symptomatically better the blood pressure is 80 x 50 mm of Hg, the patient is advised further stay in hospital but attenders are unwilling so patient is being discharged at request.

diabetic ketoacidosis
cardiogenic shock probable CAD with LV dysfunction

sudhakar rao

Patient presented with the above-mentioned complaints patient was diagnosed to have neuroglycopenia as patient had blood sugars of 26 mg/dL on arrival. Patient was treated with 25% DEXTROSE 100 mL and then put on 5% DEXTROSE Infusion at 30 cc/hour. Now the patient is symptomatically better and haemodynamically stable and is maintaining saturation on room air. The patient has been advised further stay but the patient is unwilling so patient is being discharged at request.

A 27 years old male patient Mr. BANDARI RAMESH came with c/o Left flank pain , shortness of breath, decreased urine output. All necessary investigations were done and diagnosed as SEPTIC SHOCK WITH MODS, AND UROSEPSIS WITH BILATERAL RENAL CALCULI. Poor prognosis explained to the patient attendants, suddenly patient developed severe bradycardia. INJ. Atropine and INJ. ADRENALINE given and patient desaturated, immediately, emergency intubation was done and connected to mechanical ventilator on SIMV mode with Fio2-100% and inotropic support was given. CPR started immediately, continued for 45 minutes, according to ACLS guidelines. CPR was given and continued but patient not reverted. 12 lead ECG showed flat line, peripheral pulses not felt, declared death at 03.40 AM on 17/06/2022.

C/o breathlessness since 1 month

AT ADMISSION:

Afebrile

PR: 84/min

BP: 100/70mmHg

RS: BAE+

CVS: S1S2

RR: 20/min

SPO2: 98%

P/A: Soft

A 71 years old male patient Mr. MARAM REDDY SLIVA REDDY came with c/o breathlessness since 1 month. Now, admitted for transcatheter heart valve implantation.

Course in the hospital:

Mr. Sliva Reddy M, 71 year old male presented to hospital with history of breathlessness 1 month back. On evaluation diagnosed to have severe Aortic stenosis with severe LV dysfunction, FC IV Dyspnea.

He was stabilized with medications, options of valve replacement were discussed with family as 1 year mortality in Severe AS patients with severe LV dysfunction is very high. As he is a high surgical risk candidate for Open heart surgery and tolerating heart-lung bypass, options of TAVI as well as surgery were discussed. Also advised for multiple opinions at other Cardiac centers.

Family members & Mr. Sliva reddy decided for minimally invasive TAVI procedure. All risks involved in this procedure including mortality were explained. Higher risk than normal for Coronary obstruction and risk of development of Complete Heart Block during (or) post-operatively were also explained.

After informed consent, under General anaesthesia with Aseptic precautions, Balloon occlusive Aortic root angiography done showed slow filling of Right coronary artery. Hence with a JR guide and a Catheter extending to RCA ostium. 3 x 24 mm RCA stent positioned in mid RCA for right coronary protection.

26 mm MVVAL Transcatheter Heart valve positioned across Aortic annulus and implanted at a depth of 4 mm below the

annulus. Aortic Root injection showed mild compromise of RCA ostium as longer leaflet of bicuspid valve is abutting it. Hence, RCA was stented from proximal RCA in to Aorta, good TIMI-III flow. No significant Aortic Regurgitation (or) Para valvular Leak No gradients across Aortic valve.

Patient developed LBBB intraprocedurally. Hence, Temporary Pacemaker kept in situ. After 24 hrs, Patient was in Sinus Rhythm with LBBB. Hence TPI Removed. Later same day, he progressed to complete Hear Block hence, TPI repositioned. After discussing with family, DDDR permanent pacemaker Implantation done. Good result. Parameters were normal. He was monitored for infection, hemodynamics and symptoms.

He has mild upper respiratory tract symptoms of cough with mucoid expectoration. He was continued on antibiotics. He was symptomatically better and haemodynamically stable at discharge.

DISCHARGE MEDICATION:

1. TAB. ACEBROPHYLLINE **TWICE IN A DAY AT 8 AM 8 PM** TO CONTINUE.
2. TAB. FRUSELAC DS (40/60) **TWICE IN A DAY AT 8 AM 8 PM** TO CONTINUE.

10. TAB. IVABRAD 5 MG **TWICE IN A DAY AT 8 AM 8 PM** TO CONTINUE.
11. TAB. ROSUVAS 20 MG ONCE DAILY AT 8PM TO CONTINUE.
12. TAB. FAROPENEM 200 MG **TWICE IN A DAY AT 8 AM 8 PM** FOR 1 WEEK.

REVIEW AFTER 5 DAYS TO CARDIAC OPD FOR WOUND DRESSING

RAYAMALLU %%%%%%%%%56417

Patient was taken over from Urology on 05/07/ 2022 after patient had undergone TURP and optical urethrotomy. Patient was drowsy was in hypotension and was diagnosed to have sepsis with multiorgan dysfunction syndrome. Patient was started on INJ. MEROPENEM according to creatinine clearance blood cultures and urine cultures were sent. Patient was intubated in view of poor GCS. Blood culture was sterile urine culture showed growth and antibiotics were adjusted according to sensitivity. Patient continued to require mechanical ventilation. Patient recovered from hypotension and acute kidney injury. Despite broad spectrum antibiotics patient continued to have fever spikes . Patient was extubated on 13/07 /22. Was maintaining saturation of 3 L/min of oxygen.

On 14/07/22 in the night patient's GCS drop to 3 / 15 and he had paucity of limb movements an MRI brain revealed posterior circulation infarcts. A Neurologist consultation was taken and advice was followed patient was re intubated in view of poor GCS. Patients urine output decreased nephrology consultation was taken and 2 cycles of/dialysis were done. Patient's condition did not improve with the above treatment interventions. On 20/07/2022 patient had sudden cardiac arrest at so and so time CPR was initiated according to ACLS protocol despite best efforts patient could not be revived and declared dead at so and so time.

Glioblastoma multiforme [Brain Cancer]

A 73 years old female patient Mrs. KANAKAMMA came with above mentioned complaints. The patient is a known case of glioblastoma multiforme, now presented with features of sepsis with multiple organ dysfunction. Patient's treatment was conservative in nature as attenders did not want active intervention in view of glioblastoma multiforme. Patient had UGI bleed so patient was started on INJ. PAN 8 mg/hour infusion, patient was started on broad spectrum antibiotics despite the above treatment patient continued to have bleeding and fever spikes now the patient is in hypotension and in a gasping state. The nature of the illness and the expected outcome has been explained in detail to the attenders. They have opted for End of life care and did not want any active intervention so the patient is being discharged against medical advice

PR: 98/min

BP: 110/80mmHg

RS: BAE+

CVS: S1S2

RR: 20/min

SPO2: 98%

P/A: Soft

A 32 years old male patient SHIVA RAM came with c/o chest pain, diagnosed as AWSTEMI. He was immediately taken up of a primary angioplasty. CAG showed high thrombus burden in LAD with proximal LAD total occlusion. After opening LAD, more like distal LAD with a parallel large diagonal. Thrombus aspiration done, achieved TIMI-III flow, same day patient developed chest pain with mild ST- elevation hence, CAG done showed stent thrombosis with total occlusion. PTCA to LAD done and Vessel opened. Patient started on Tirofiban infusion and changed antiplatelets to Ticagrelor. He was observed to post PCI for 5 days. No further cardiac events. Pre discharge echo showed RWMA Apical anterior wall and Antero-septal wall, but only mild LV dysfunction. He was advised DAPT with Ticagrelor and risk of stent thrombosis.

DISCHARGE MEDICATION:

1. TAB. ATORVA 40 MG ONCE DAILY AT 8PM TO CONTINUE.

SEPSIS WITH MODS AND ACUTE CVA

C/o generalised weakness, decreased urine output

AT ADMISSION:

PR: 98/min

BP: 110/60mmHg

RS: BAE+

CVS: S1S2

RR: 20/min

SPO2: 98%

P/A: Soft

A 65 years old male patient Mr. RAYAMALLU came with above mentioned complaints. Patient was taken over from Urology on 05/07/ 2022 after patient had undergone TURP and optical urethrotomy. Patient was drowsy was in hypotension and was diagnosed to have sepsis with multiorgan dysfunction syndrome. Patient was started on INJ. MEROPENEM according to creatinine clearance blood cultures and urine cultures were sent. Patient was intubated in view of poor GCS. Blood culture was sterile urine culture showed growth and antibiotics were adjusted according to sensitivity. Patient continued to require mechanical ventilation. Patient recovered from hypotension and acute kidney injury. Despite broad spectrum antibiotics patient continued to have fever spikes . Patient was extubated on 13/07 /22. Was maintaining saturation of 3 L/min of oxygen. On 14/07/22 in the night patient's GCS drop to 3 / 15 and he had paucity of limb movements an MRI brain revealed posterior circulation infarcts. A Neurologist consultation was taken and advice was followed patient was re intubated in view of poor GCS. Patients urine output decreased nephrology consultation was taken and 2 cycles of/ were done. Patient's condition did not improve with the above treatment interventions. On 20/07/2022 patient had sudden cardiac arrest at so and so time CPR was initiated according to ACLS protocol despite best efforts patient could not be revived and declared dead at so and so time.

A 65 yrs old male patient Mr. JALALUDDIN MOHAMMED came with history of chest pain. He is a known case of CAD, S/P CABG (LIMA to LAD, SVG to OM, PTCA to RCA). On evaluation ECG showed significant ST depression and Trop-T significantly positive suggestive of NSTEMI. He was severely anaemic at the time of admission with haemoglobin of 7 g/dL. He also has a history of duodenal ulcer. Hence he was managed medically initially Gastroenterology

evaluation with upper GI scopy showed only antral ulcers and chronic duodenal ulcer with no active bleeding. After informed consent and explaining risk to family, he was taken up for CAG. CAG showed ostial LMCA 99% stenosis, LCx normal, LAD mid total occlusion. RCA stent patent with mild ISR. LIMA to LAD patent with good distal runoff. SVG to OM occluded. As blood flow to LCx is through LMCA, family was explained the need for PCI to protected LMCA. PTCA to LMCA done with 4 x 15 mm ONYX stent and post-dilated to 5 x 10 mm NC balloon. Good result, TIMI-III flow. Patient explained the need to stop smoking and risk of stent thrombosis and in stent restenosis. He is stable and asymptomatic at discharge.

DISCHARGE MEDICATION:

1. TAB. ECOSPRIN 150MG ONCE DAILY AT 2PM TO CONTINUE.
2. TAB. CLOPILET 75MG ONCE DAILY AT 2PM TO CONTINUE.

A 54 years old female patient Mrs. Farzana known diabetic presented with a history of worsening dyspnoea since 15 days. On evaluation, she was diagnosed to be in LV failure, she was started on IV diuretics, NIV and other acute HF regimen. She improved symptomatically and got stabilized. CAG done showed diffusely diseased LAD and LCx and

RCA has severe stenosis in the proximal and distal segments. Her anatomy is not suitable for bypass surgery, which was discussed today with her husband, only revascularisation of RCA is possible and this limited options clearly explained due to husband. PTCA to RCA done. TIMI-III flow, she was stable and in controlled. Heart failure status, her delicate situation of heart failure and possibility of acute decompensated heart failure and cardiogenic shock clearly explained to husband. Advised salt and fluid restriction.

GCS-10/15

A 65 year old male patient Mr. RAYAMALLU came with above mentioned complaints. Patient was taken over from Urology on 05/07/ 2022 after patient had undergone TURP and optical urethrotomy. Patient was drowsy, was in hypotension and was diagnosed to have sepsis with multiorgan dysfunction syndrome. Patient was started on INJ. MEROPENEM according to creatinine clearance. Blood cultures and urine cultures were sent. Patient was intubated in view of poor GCS. Blood culture was sterile urine culture showed growth and antibiotics were adjusted according to sensitivity. Patient continued to require mechanical ventilation. Patient recovered from hypotension and acute kidney injury. Despite broad spectrum antibiotics patient continued to have fever spikes . Patient was extubated on 13/07 /22. Was

maintaining saturation of 3 L/min of oxygen. On 14/07/22 in the night, patient's GCS dropped to 3 / 15 and he had paucity of limb movements an MRI brain revealed posterior circulation infarcts. A Neurologist consultation was taken and advice was followed. Patient was re intubated in view of poor GCS. Patient's urine output decreased nephrology consultation was taken and 2 cycles of SLED were done. Patient's condition did not improve with the above treatment. On 20/07/2022 patient had sudden cardiac arrest at 04.40 AM CPR was initiated according to ACLS protocol despite best efforts patient could not be revived and declared dead at 04.47 AM on 20/07/2022.

P/A: Soft,

A 71 years old male patient Mr. CHANDRAIAH BELLI presented with history of chest pain, shortness of breath on exertion. On evaluation diagnosed to have CAD -EVOLVED AWMI (late presentation), MILD LV DYSFUNCTION (EF-45%), SR. Coronary angiogram done on 27/07/22 showed CAD - triple vessel disease. Plan CABG. Patient attenders were explained the need for CABG as earliest as possible. Patient complaint of burning micturition and increased frequency. USG abdomen showed grade III prostatomegaly, left renal parapelvic cyst (20 x 18 mm) with bilateral grade I renal parenchymal changes, CUE showed no pus cells, hence advised Urologist opinion. Patient attenders are willing for discharge hence discharged in haemodynamically stable condition at their request.
